

Proposal by Cedric Hilary Samah (86350)

Project Title: Persatuan Kenyah Badeng Sarawak (KEBANA) Management System

Basic Skills:

1. Web Development Skills
 - Frontend: HTML, CSS, JavaScript, responsive design
 - Backend: PHP (Laravel Framework)
2. Database Management
 - MySQL database design, CRUD operations, schema creation.
3. Software Development
 - Basics system design (Architecture, UI/UX mockups using Figma)
 - Requirements analysis and documentation
4. Version Control & Deployment
 - Familiar with GitHub tools in deploying and using webhook tools.
5. Multimedia Skills
 - Adobe Photoshop
 - Adobe Premiere Pro
 - Videography and photography

Problem Statement:

The Kenyah Badeng National Association (KEBANA) serves a widespread community originating from numerous remote villages in Sarawak, primarily in the Belaga and Ulu Baram areas. Annually, the association organizes the "Ramai Biu' KEBANA" festival, a significant cultural event held in both rural villages and major towns.

However, the planning and management of this festival face significant operational challenges. The organizing committee currently relies on traditional, manual processes for essential administrative functions, including event documentation, the creation of proposals, and the generation of financial reports. This reliance on manual methods is fundamentally inefficient and unsustainable for two key reasons:

1. Geographical Dispersion: Committee members are not centrally located but are scattered throughout Malaysia.
2. Lack of Centralization: There is no single, accessible platform for collaboration and data management.

Consequently, this manual approach leads to considerable administrative overhead, a high risk of data loss or inconsistency, and significant delays in decision-making, ultimately compromising the efficiency and success of their most important community event.

Objectives:

This project aims to achieve the following objectives:

1. To design and develop an event management module that allows KEBANA committee members to create events, manage proposals, and archive related documentation in a centralized online repository.
2. To implement a financial management module capable of tracking income and expenditures, and generating automated financial reports to ensure accuracy and transparency for auditing purposes.
3. To create a centralized and searchable database for managing the personal and membership details of all KEBANA members, replacing the current manual record-keeping methods.

Project Descriptions:

This project involves the design and development of the KEBANA Management System, an interactive web-based platform tailored specifically for the Persatuan Kenyah Badeng Sarawak. The system's primary goal is to provide a centralized digital environment to overcome the challenges of manual administration and geographical separation among committee members.

The development is planned in two phases. The Project Scope for this Final Year Project is strictly focused on Phase 1, which covers the development of the administrative backend. This includes core functionalities for authenticated committee members, such as:

- A dashboard to view upcoming events and association announcements.
- An event management module for creating new events and activities.
- A document management feature for uploading and archiving proposals and reports.
- A financial module for transparent and accurate financial reporting.

Phase 2, which will be designated as Future Work beyond the scope of this project, will involve the development of a user-facing portal for the general KEBANA community members.
